

Standard Modified Plaster

Also called marcite, marblelite plaster is an age old process of finishing many structures. Used underwater, it provides the water-tight seal that the more porous gunite or shotcrete beneath cannot. Plaster finishes can provide twenty years or more of service if the water is maintained properly.

Marblelite plaster consists of marble dust sand, Portland white cement and modifiers to help improve the durability of the surface.

Custom color variations can be created by adding UV protected dyes and/or colorquartz crystals
For endless possibilities!
